

Task 5 — Insights & Summary

1 Which features influence house price the most?

The features that most strongly drive up house prices are the number of bathrooms, the presence of air conditioning, and the total square footage (area). Conversely, an unfurnished status drops the value significantly.

2 How accurate was your model (in plain terms)?

The Linear Regression model was moderately accurate, explaining about 65.3% of the variations in house prices ($R^2 = 0.65$) and outperforming the Random Forest model.

3 What surprised you in the data?

I was surprised that the simpler Linear Regression model actually beat the more complex Random Forest model

4 One recommendation for a real estate business based on your findings

Real estate agents should strongly advise sellers to invest in air conditioning or stage their homes with furniture before listing, as the data shows these specific features yield massive returns on the final sale price.
